CASE STUDY

OFFICIAL MEDICINES CONTROL LABORATORY

An Official Medicines Control Laboratory responsible for ensuring the quality and safety of biological medicines faced operational challenges due to reliance on a legacy Oracle-based system for batch release management. Manual processes for tracking sample lifecycles and managing component relationships created inefficiencies.

To address these challenges and reduce reliance on IT support, the organization chose to implement Agaram's **Qualis LIMS** as Clinical Research & Trials LIMS, a modern, web-based laboratory information management system.

By digitizing the entire testing lifecycle, from sample receipt to final certificate issuance, Qualis LIMS enabled streamlined operations and improved traceability

IMPLEMENTATION OF CLINICAL RESEARCH & TRIALS LIMS FOR BATCH RELEASE MANAGEMENT IN AN OFFICIAL MEDICINES CONTROL LABORATORY

Client: Official Medicines Control Laboratory (OMCL)

Partner: Agaram Technologies

Objective: Implement a modern, robust, and web-based Clinical Research & Trials Laboratory Information Management System to replace the legacy system and meet current and future batch release needs.

BACKGROUND & CHALLENGES

A national control laboratory responsible for safeguarding public health undertakes independent testing of batches of biological medicines intended for use in the UK or elsewhere in the EU. The analyses conducted are largely defined by the terms of the product licence or informed by scientific expertise specific to the product, and are performed against a range of established specifications. This testing process culminates in the issuance of a certificate of authorisation, permitting the use of that specific batch of product.

Despite the critical nature of this work, the laboratory faces several operational and technical challenges, including:

- Reliance on a legacy system with limited functionality.
- Inability to efficiently track relationships and hierarchy across batch components.
- High dependency on full-time IT development support for system maintenance.
- Manual processes for capturing and managing data from product receipt to batch release.
- Lack of a modern, user-friendly, web-based system to meet current and future needs.
- Insufficient support for regulatory compliance and evolving batch release requirements.

THE SOLUTION: CLINICAL RESEARCH & TRIALS LIMS

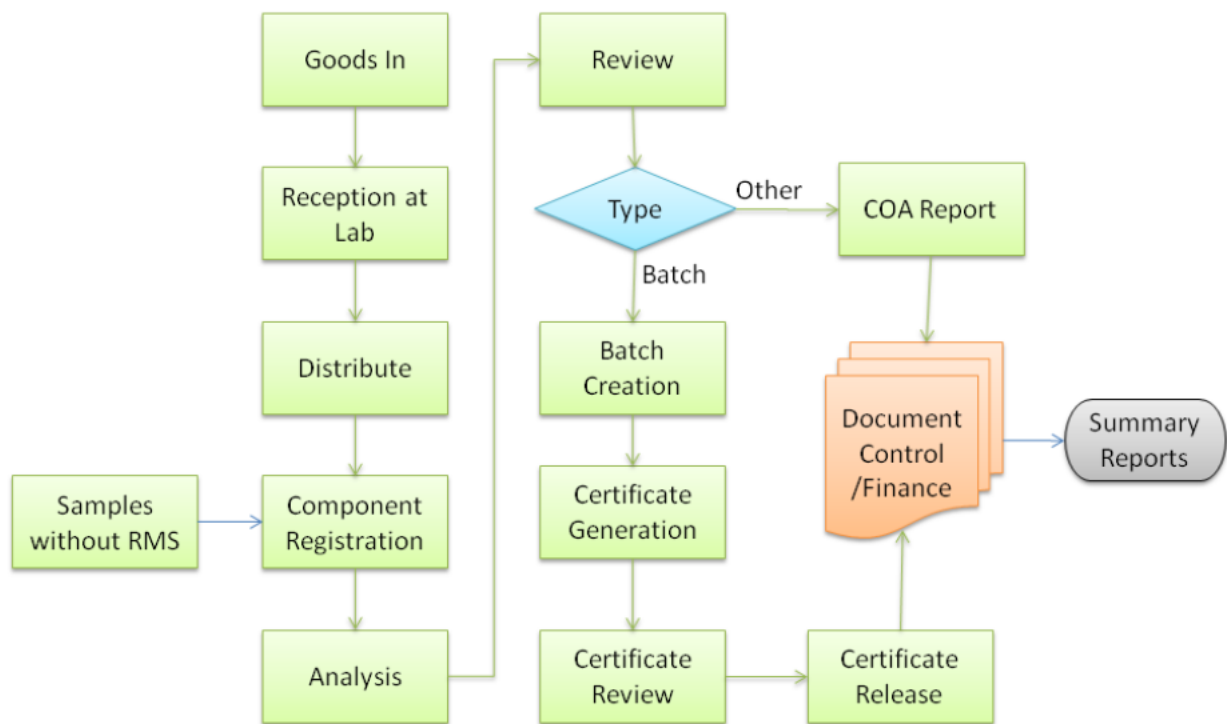

The required solution was a simple, innovative, and logically structured system that would be easy to use and not reliant on full-time IT development support for ongoing management and

maintenance. Control Testing Laboratory Information Management System (CT-LIMS) was expected to fulfill these requirements by providing a user-friendly platform capable of operating efficiently with minimal technical overhead.

The system needed to capture and manage data related to the arrival of products at the agency and support end-to-end tracking through the complete testing lifecycle, from initial receipt to batch release and final data archiving. Batches are made up of multiple components, some of which are common to more than one batch. As such, the system needed to be able to track the relationship and hierarchy across different testing areas to ensure data integrity and efficient batch release processes. As part of this solution, a sample lifecycle clock was also introduced to monitor the duration of each batch's testing journey. This feature addressed a critical operational KPI by ensuring transparency around testing timelines and helping guarantee that batch certificates were issued within the required timeframes.

The solution also required a modern, robust, web-based platform to replace legacy systems and to meet both current and future batch release needs effectively.

CT-LIMS WORKFLOW

KEY CAPABILITIES

- ✅ **Streamlined Sample Handling:** Automated receipts and distribution of samples ensure efficient lab operations.
- ✅ **Centralized Test Management:** Integrated registration and planning enhance coordination and reduce errors.
- ✅ **Controlled Data Integrity:** Structured result entry and approval process ensures accuracy and traceability.
- ✅ **Hierarchical Component Tracking:** Tracks complex batch-component relationships across multiple testing areas.

- ✓ **Sample Lifecycle Monitoring:** Tracks the duration of each batch's testing process to ensure the batch certificates were released on or before the due period.
- ✓ **Modern User Experience:** Web-based interface improves usability and reduces training overhead.
- ✓ **Reduced IT Dependency:** Minimal reliance on full-time IT support enables smoother ongoing maintenance.

OUTCOMES & BENEFITS

73%↓

Manual
Busywork

80%↑

Operational
efficiency

79%↑

Workflow
Automation

90%↑

Data
Traceability

- Reduced manual dependency on legacy systems
- Enhanced traceability of components and batch relationships across operations
- Improved operational efficiency via secure, web-based interface
- Automated certificate generation and email delivery for faster communication
- Future-ready system supporting upcoming batch release requirements

WHY AGARAM TECHNOLOGIES?

We specialize in **digitizing laboratory ecosystems** with a focus on compliance, connectivity, and usability.

Looking to digitize and automate lab operations in your pharma production environment?

To see [Qualis LIMS](#) action, request a demo and get a detailed overview [here](#).

Contact us at info@agaramtech.com to explore how we can support your transformation journey.

**Compliance-Ready | Digitally
Traceable | Scalable | Secure**

Automate and streamline your lab operations today!
